Project Title : Telecom Customer Churn Analytics:

Problem Statement:

The objective of this project is to analyze customer churn in a telecom company. Customer churn refers to the phenomenon where customers switch from one service provider to another or cancel their subscription altogether. By analyzing customer chum patterns, we aim to identify the factors that contribute to churn and develop strategies to mitigate it.

Project Description:

In this project, we will work with a dataset from a telecom company that includes information about their customers, such as demographics, customer Accounting information, Service information. The dataset will also include a churn indicator that specifies nether a customer has churned or not.

Desired problen come(Objective or goal)The main objective is to find out the reasons for call drops and voice connectivity Built a classification predictive model to predict call drop

DesiredOutcome:

our main goal is to bulid a computer program that can predict when a customer might leave the company

Algorithms:

LogisticRegression, DecisionTreeClassifier, RandomForestClassifier, AddaboostClassifier, GradientBoostClassifier, and Classifier, Classifi

About Data

Data is divided into 3 Types

Demographic information:

- gender: Whether the customer is a male or a female.
- SeniorCitizen: Whether the customer is a senior citizen or not (1, 0).
- Partner: Whether the customer has a partner or not (Yes, No)
- Dependents: Whether the customer has dependents or not (Yes, No)

Customer Acconting Information:

- Contract: The contract term of the customer (Month-to-month, One year, Two year)
- PaperlessBilling: Whether the customer has paperless billing or not (Yes, No)
- · MonthlyCharges: The amount charged to the customer monthly
- TotalCharges: The total amount charged to the customer
- tenure: Number of months the customer has stayed with the company
- PaymentMethod: The customer's payment method (Electronic check, Mailed check, Bank transfer (au card (automatic))
- customeriD: Customer ID

Service information

PhoneService: Whether the customer has a phone service or not (yes, No)

- MultipleLines: Whether the customer has multiple lines or not (yes, No, No phone service)
- InternetService: Customer's internet service provider (DSL, Fiber optic, No)
- OnlineSecurity: Whether the customer has online security or not (yes, No, No internet service)
- OnlineBackup: Whether the customer has online backup or not (Yes, No, No internet service)
- DeviceProtection: Whether the customer has device protection or not (yes, No, No internet service)
- TechSupport: Whether the customer has tech support or not (yes, No, No internet service)
- Streaming TV: Whether the customer has streaming TV or not (Yes, No, No internet service)
- •StreamingMovies: Whether the customer has streaming movies or not (Yes, No, No internet service)

Traget variable

• Churn: Whether the customer churn or not (yes or No)*

SeniorCitizen is actually a categorical hence the 25%-50%-75% distribution is not propoer

75% customers have tenure less than 55 months

Average Monthly charges are USD 64.76 whereas 25% customers pay more than USD 89.85 per month

4. Missing Value Treatement

Since the % of these records compared to total dataset is very low ie 0.0015%, it is safe to ignore them from further processing.

5. Divide customers into bins based on tenure e.g. for tenure < 12 months: assign a tenure group if 1-12, for tenure between 1 to 2 Yrs, tenure group of 13-24; so on...

```
In [23]:
          1 # Get the max tenure
           2 print(telco data['tenure'].max()) #72
         72
In [24]:
           2 # Define the bins and labels
           3 bins = [0, 12, 24, 36, 48, 60, 72]
           4 labels = ['1 - 12', '13 - 24', '25 - 36', '37 - 48', '49 - 60', '61 - 72']
           6 # Create the tenure group column
           7 telco data['tenure group'] = pd.cut(telco data['tenure'], bins=bins, labels=labels, right=False)
              telco data['tenure group'].value counts()
In [25]:

Data Exploration

*1. * Plot distibution of individual predictors by churn

Univariate Analysis

```
In [28]:
           1 for i, predictor in enumerate(telco_data.drop(columns=['Churn', 'TotalCharges', 'MonthlyCharges'])):
                  plt.figure(i)
           2
           3
                  sns.countplot(data=telco data, x=predictor, hue='Churn')
```

2. Convert the target variable 'Churn' in a binary numeric variable i.e. Yes=1; No = 0

```
1 telco_data['Churn'] = np.where(telco_data.Churn == 'Yes',1,0)
In [29]:

[&]quot;As you can see that the accuracy is quite low, and as it's an imbalanced dataset, we shouldn't consider Accuracy as our metrics to measure the model, as Accuracy is cursed in imbalanced datasets. Hence, we need to check recall, precision & f1 score for the minority class, and it's quite evident that the precision, recall & f1 score is too low for Class 1, i.e. churned customers. Hence, moving ahead to call SMOTEENN (UpSampling + ENN)"

[&]quot;main advantage of using SMOTEENN is that it addresses both overfitting and underfitting issues that can arise from class imbalance. By generating synthetic samples and removing noisy ones"

Over-sampling
